

And Choking Hazard Prevention

The causes of choking hazard

- Food
- Toys
- Others

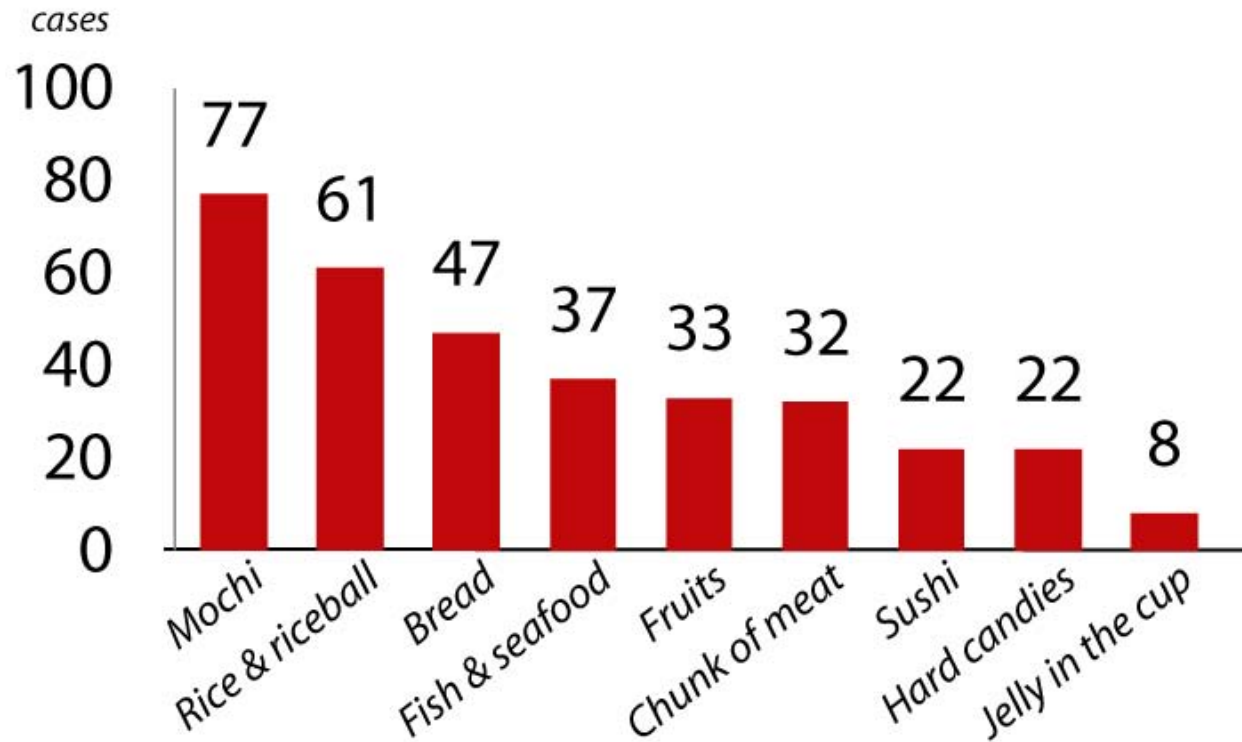

The condition of choking hazard

© Japan Dental Association

- The respiratory track is blocked. The air can't flow in and out.
- Adult's respiratory tube diameter is around 2cm.
- **Children's respiratory tube diameter is less than 1cm.**

Top 9 food that cause choking

* Ministry of Health - Special Research 2007

Oralcryst© Junior's choking hazard prevention

- Diameter of Oralcryst Junior tablet is 11mm. Big enough to not enter respiratory track.
- 4mm center hole to keep the air to flow in and out (the smallest “live saver” on earth).
- Flat tablet (4mm height). In case swallowed horizontally, it will still allow air to flow.

Oralcryst© Junior's tablet density consideration

- It is just hard enough for kids to suck it then chew it slowly. It is important that the tablet stays in the mouth as long as it could be.
- Chewing harder food also help toddlers to build strong jaw muscles.
- There is no coating on the tablet, it will dissolve slowly in the mouth.
- However, this tablet is intended for toddlers with molar teeth and able to chew.
